5 PIPERIDINE MCH ANTAGONISTS AND THEIR USE IN THE TREATMENT OF OBESITY

10 BACKGROUND OF THE INVENTION

This invention relates to amide derivatives of 1,4-di-substituted piperidine antagonists for melanin-concentrating hormone (MCH) and their use in the treatment of obesity and diabetes.

MCH, a cyclic peptide, was first identified over a decade ago in teleost fish where it appears to regulate color change. More recently, MCH has been the subject of investigation for its possible role as a regulator of eating behavior in mammals. As reported by Shimada et al., *Nature*, Vol. 396 (17 Dec. 1998), pp. 670-673, MCH-deficient mice have reduced body weight and leanness due to hypophagia (reduced feeding). In view of their findings, the authors have suggested that antagonists of MCH action may be effective for the treatment of obesity. U.S. Patent No. 5,908,830 discloses a combination therapy for the treatment of diabetes or obesity involving the administration of a metabolic rate increasing agent and a feeding behavior modifying agent, an example of the latter being an MCH antagonist.

Piperidine-derivative muscarinic antagonists useful in the treatment of cognitive disorders such as Alzheimer's disease are disclosed in US 6,037,352. In particular, US 6,037,352 discloses compounds of the generic formula

wherein, inter alia, Y is CH; Z is N; X is -NHCO -; R is substituted benzyl or cycloalkylalkyl; R1, R21, R3, R4, R27 and R28 are each hydrogen; and R2 is optionally substituted cycloalkyl or arylalkyl. US 6,037,352 does not disclose the use of the compounds for treating obesity or diabetes.

15 DETAILED DESCRIPTION

Referring to formula I, above, one group of preferred compounds is that wherein W is R^1 -CR³R¹²NR⁴C(O)-.

R^1 is preferably R^5 -phenyl. R^5 is preferably H, halogen, C_1 - C_6 alkyl or phenyl, more preferably halogen or phenyl.

20 Another group of preferred compounds is that wherein R^2 is R^6 -aryl, especially when n is 1. More preferred is R^6 -aryl wherein "aryl" is phenyl and R^6 is 1-2 substituents.

X is preferably -CHR⁸ wherein R^8 is H and Y is CH, or X and Y form a double bond.

25 R^3 is preferably ethyl or methyl, and R^4 and R^{12} are each preferably H.

R^{10} is preferably H or -CH₃; when n is 2-5, preferably only one R^{10} is alkyl and the rest are hydrogen.

30 Except where stated otherwise, the following definitions apply throughout the present specification and claims. These definitions apply regardless of whether a term is used by itself or in combination with other terms. Hence the definition of "alkyl" applies to "alkyl" as well as to the "alkyl" portions of "alkoxy", etc.

"Alkyl" represents a straight or branched saturated hydrocarbon chain having the designated number of carbon atoms. Where the number of carbon atoms is not specified, 1 to 6 carbons are intended.

35 "Cycloalkyl" represents a saturated carbocyclic ring having 3 to 8 carbon atoms.

The term "heterocycloalkyl" refers to 4- to 7-membered saturated rings comprising 1 to 3 heteroatoms independently selected from the group consisting of -O-, -S- and -NR⁷-, wherein R^7 is H or C_1 - C_6 alkyl, and wherein the remaining ring

members are carbon. Where a heterocyclic ring comprises more than one heteroatom, no rings are formed where there are adjacent oxygen atoms, adjacent sulfur atoms, or three consecutive heteroatoms. Examples of heterocyclic rings are tetrahydrofuranyl, pyrrolidinyl, tetrahydropyranyl, piperidinyl, morpholinyl, 5 thiomorpholinyl and piperazinyl.

Halogen represents fluoro, chloro, bromo or iodo.

Aryl represents a monoaromatic ring or a bicyclic fused ring system of 6- to 10 carbon atoms, possessing one or two aromatic rings including, but not limited to, phenyl, naphthyl, tetrahydronaphthyl, indanyl, and the like.

10 Heteroaryl means a 5- to 10-membered single or benzofused aromatic ring comprising 1 to 3 heteroatoms independently selected from the group consisting of -O-, -S- and -N=, provided that the rings do not include adjacent oxygen and/or sulfur atoms. Examples of single ring heteroaryl groups are pyridyl, isoxazolyl, oxadiazolyl, furanyl, pyrrolyl, thienyl, imidazolyl, pyrazolyl, tetrazolyl, thiazolyl, thiadiazolyl, 15 pyrazinyl, pyrimidinyl, pyridazinyl and triazolyl. Examples of benzofused rings are indolyl, benzofuranyl, quinolyl, quinazolinyl, quinoxalinyl, benzoxazolyl, benzothiazolyl, benzothiadiazolyl, thianaphthenyl, and benzofurazanyl. N-oxides are also included. All positional isomers are contemplated, e.g., 2-pyridyl, 3-pyridyl and 4-pyridyl.

When a variable appears more than once in the structural formula, for example 20 R⁵, the identity of each variable appearing more than once may be independently selected from the definition for that variable.

N-oxides can form on a tertiary nitrogen present in an R¹ or R² substituent, or on =N- in a heteroaryl ring substituent and are included in the compounds of formula I.

For compounds of the invention having at least one asymmetrical carbon atom, 25 all isomers, including diastereomers, enantiomers and rotational isomers are contemplated as being part of this invention. The invention includes d and l isomers in both pure form and in admixture, including racemic mixtures. Isomers can be prepared using conventional techniques, either by reacting optically pure or optically enriched starting materials or by separating isomers of a compound of formula I. The 30 preferred stereochemistry for compounds of the invention wherein W is R¹-CR³R¹²NR⁴C(O)- is shown in formula IA:

Compounds of formula I can exist in unsolvated and solvated forms, including hydrated forms. In general, the solvated forms, with pharmaceutically acceptable

solvents such as water, ethanol and the like, are equivalent to the unsolvated forms for purposes of this invention.

A compound of formula I may form pharmaceutically acceptable salts with organic and inorganic acids. Examples of suitable acids for salt formation are hydrochloric, sulfuric, phosphoric, acetic, citric, malonic, salicylic, malic, fumaric, succinic, ascorbic, maleic, methanesulfonic and other mineral and carboxylic acids well known to those skilled in the art. The salts are prepared by contacting the free base forms with a sufficient amount of the desired acid to produce a salt in the conventional manner. The free base forms may be regenerated by treating the salt with a suitable dilute aqueous base solution, such as dilute aqueous sodium hydroxide, potassium carbonate, ammonia or sodium bicarbonate. The free base forms differ from their respective salt forms somewhat in certain physical properties, such as solubility in polar solvents, but the salts are otherwise equivalent to their respective free base forms for purposes of the invention.

Compounds of formula I can be produced by processes known to those skilled in the art using either solution phase or solid phase synthesis as shown in the following reaction schemes and in the preparations and examples below:

Compounds of Formula I wherein W is $R^1-CR^3R^{12}NR^4C(O)-$ can be produced as shown in Scheme 1.

20 Scheme 1

The synthesis of compounds such as 3 can be accomplished by the reaction of 9-borabicyclo[3.3.1]nonane (9-BBN) with an olefin such as 1 followed by the Suzuki coupling with an aryl halide such as 1a to afford compounds 2. Hydrolysis of ester 2 and subsequent deprotection of the N-Boc provides the amino acid intermediate which is protected by treatment with 9-fluorenylmethoxycarbonyl oxysuccinimide

(FmocOSU). This product is then converted into the acid chloride **3** upon treatment with reagents such as POCl_3 or oxalyl chloride.

The amine ($\text{R}^1\text{CR}^{12}\text{R}^3\text{NR}^5\text{H}$) is reacted with Argopore-MB-CHO resin (Argonaut Corporation, San Carlos, CA) by reductive alkylation with sodium triacetoxyborohydride. Subsequent acylation of the resin-bound amine with activated acids such as acid chlorides **3**, deprotection of the N-Fmoc group, followed by reductive alkylation with aldehydes or ketones, or reaction with an aldehyde followed by treatment with a Grignard reagent, or by reaction with the appropriate mesylate or alkyl halide, provides a resin bound intermediate, which on treatment with trifluoroacetic acid (TFA) produces compounds of Formula I.

Compounds of Formula I wherein W is $\text{R}^{11}\text{C}(\text{O})\text{NR}^4$ can be prepared according to Scheme 2.

Scheme 2:

15

Compounds **10** can be prepared by the route shown in Scheme 2 by first converting an acid such as **4** into an amine such as **6** by the Curtius reaction, for example by treatment with diphenylphosphoryl azide in an alcohol such as t-butanol followed by hydrolysis. Subsequent reaction with a resin-bound aldehyde such as the Argopore MB-CHO resin under reducing conditions provides a resin-bound amine **7** which can be further functionalized by reaction with activated carboxylic acid derivatives such as acid chlorides. Removal of the Fmoc group and reductive

20

alkylation with carbonyl-containing compounds, followed by treatment with acid to remove the compound from the polymeric resin, provides compounds 10.

- Alternatively, compounds of formula I are prepared as shown in Scheme 3 by reacting an aryl bromide such as 11a with an alkyl lithium reagent, followed by addition of an aryl isocyanate. Subsequent removal of the BOC group from compound 12 by treatment with acid and then introduction of the R² group by alkylation or reductive alkylation provides compounds such as 13. Furthermore, 11 can also be elaborated into compounds such as 11i as shown in Scheme 3.

Scheme 3:

10

Compounds wherein R¹⁰ is alkyl can be prepared by the following procedure:

Scheme 4:

Additional compounds of formula I are prepared according to the route shown in Scheme 5 (specific compounds are shown, but the procedure may be modified to make other compounds within the scope of formula I):

Scheme 5:

Compounds of formula I wherein W is $R^1-CR^3R^{12}NR^4C(O)-$ and R^1 is biphenyl can be prepared by the Suzuki coupling reaction:

- 10 The iodophenyl analogs on Argopore-MB-CHO resin are treated with phenylboronic acid, K_2CO_3 , $Pd(dppf)Cl_2$ and 1-methyl-2-pyrrolidinone. The resin is washed, then cleaved using 10% TFA/ CH_2Cl_2 .

Starting materials are prepared by known methods and/or methods described in the Preparations.

- 15 The compounds of formula I exhibit MCH receptor antagonizing activity, which has been correlated with pharmaceutical activity for treating eating disorders, such as obesity and hyperphagia, and diabetes.

- The compounds of formula I display pharmacological activity in a test procedure designed to demonstrate MCH receptor antagonist activity. The compounds are non-toxic at pharmaceutically therapeutic doses. Following is a description of the test procedure.

MCH receptor binding assay

Membranes from CHO cells expressing the MCH receptor were prepared by lysing cells with 5 mM HEPES for 15 min at 4°C. Cell lysates were centrifuged (12,500 x g, 15 min) and the pellet was resuspended in 5 mM HEPES. For each 96-well plate (Microlite, Dynex Technologies), 1 mg of cell membranes were incubated with 10 mg of wheat germ agglutinin SPA beads (Amersham) for 5 min at 4°C in a volume of 10 ml of binding buffer (25 mM HEPES, 10 mM MgCl₂, 10 mM NaCl, 5 mM MnCl₂, 0.1% BSA). The membrane/bead mixture was centrifuged (1500 x g, 3.5 min), the supernatant was aspirated, and the pellet was resuspended in 10 ml binding buffer. The centrifugation, aspiration and resuspension were then repeated. The membrane/bead mixture (100 μ l) was then added to 96-well plates containing 50 μ l of 500 pM [¹²⁵I]-MCH (NEN) and 50 μ l of the appropriate concentration of compound (4X the desired final concentration). Nonspecific binding was determined by including 1 μ M MCH in the binding reaction. The binding reaction was incubated at room temperature for 2 h. Plates were then analyzed in a TOPCOUNT microplate scintillation counter (Packard). Data was analyzed and K_i values were determined using GraphPad Prim.

For the compounds of this invention, a range of MCH receptor binding activity (K_i values) of from about 3 nM to about 1500 nM was observed. Compounds of this invention preferably have a binding activity in the range of from about 3 nM to about 500 nM, more preferably from about 3 to about 200 nM, and most preferably from about 3 to about 80 nM.

Preferably the compound is administered orally.

Preferably, the pharmaceutical preparation is in a unit dosage form. In such form, the preparation is subdivided into suitably sized unit doses containing appropriate quantities of the active component, e.g., an effective amount to achieve the desired purpose.

The quantity of active compound in a unit dose of preparation may be varied or adjusted from about 1 mg to about 100 mg, preferably from about 1 mg to about 50 mg, more preferably from about 1 mg to about 25 mg, according to the particular application.

Preparation 1

See Scheme 1, above.

- Mix starting material 1 (1 g) with 9-BBN (10.2 ml of a 0.5 M THF solution), place under a N₂ atmosphere and heat to reflux for 1 h. To the cooled solution add methyl 4-bromobenzoate (1.09 g), K₂CO₃ (0.84 g), PdCl₂(dppf) (0.21g), Ph₃As (0.155 g), DMF (7 ml) and water (1.1 ml) and heat at 65 °C for 3 h. Pour the reaction mixture into ice water, extract into EtOAc and purify the organic layer by flash chromatography (Hex: EtOAc (90:10) to yield compound 2 (1.1 g). Dissolve compound 2 (1.1 g) in CH₃OH (20 ml) and add LiOH (0.2g) and water (7.5 ml). After heating to reflux for 1 h, cool the reaction mix, remove the CH₃OH under vacuum and acidify the mixture with HCl. Collect the solid by filtration and dry in vacuo, and dissolve in 4 M HCl in dioxane (35 ml) and stir for 1.5 h. Add ether and collect the solid (0.67 g) by filtration. Add the solid (0.66 g) to a solution of Na₂CO₃ (0.6g) in water (120 ml) and dioxane (40 ml) followed by dropwise addition at 0 °C of a solution prepared from Fmoc-OSuc (0.87g) and dioxane (10 ml). After 2 h at rt, remove the dioxane under vacuum and acidify the mixture with HCl. Collect the solid by filtration and dry in vacuo (0.93 g, LCMS 442.1[M+H]). Treat the residue with oxalyl chloride in CH₂Cl₂ to obtain the title compound.

Preparation 2Step 1:

- To a solution of (R)-α-methylbenzylamine (7.0 g, 57.8 mmol, 1 eq) 10 ml EDC was added trifluoroacetic anhydride (10 ml, 1.22 eq) in EDC (10 ml) below 30 °C. The mixture was stirred for 1.5 h and then cooled to 0 °C. Iodine (7.0 g, 0.48 eq) was added, followed by addition of bis(trifluoroacetoxy)iodobenzene (12.6 g, 0.5 eq). The mixture was stirred overnight and quenched by 10 % Na₂S₂O₃ (130 ml). 130 ml CH₂Cl₂ was added and the organic layer was washed with saturated NaHCO₃. After drying over Na₂CO₃ and removing CH₂Cl₂, the solid was dissolved in ether (50 ml) by heat, followed by addition of hexane (150 ml). White solids were precipitated out and the mixture was further stirred for 2 h. Filtration afforded white crystal, which was washed with hexane (30 ml x 2) and air-dried. 9.2 g of the desired product was obtained in 46 % yield. ¹HNMR (CDCl₃): δ 1.6 (d, 3 H, J = 7.3 Hz), 5.08 (m, 1 H), 6.40 (br s, 1 H), 7.05 (d, 2 H, J = 8.3 Hz), 7.70 (d, 2 H, J = 8.3 Hz).

Step 2:

The product of step 1 (1 g, 2.91 mmol, 1 eq) was dissolved in CH₃OH (35 ml), water (10 ml) and 2N NaOH (6 ml). The solution was stirred overnight and TLC showed complete conversion. The solvent was removed and extraction with CH₂Cl₂ several times provided the desired product as colorless oil (0.69 g, 96 % yield).

5 ¹HNMR (CDCl₃): δ 1.22 (d, 3 H, J = 6.5 Hz), 1.40 (s, 2 H), 3.98 (q, 1 H, J = 6.6 Hz), 7.00 (d, 2 H, J = 8.3 Hz), 7.58 (d, 2 H, J = 8.3 Hz).

¹³CNMR (CDCl₃): δ 27.12, 51.98, 93.09, 128.92, 138.36, 148.38.

HRMS for C₈H₁₁IN (M + 1) calcd: 247.9936; found: 247.9936.

Preparation 3

10

To a solution of the product of Preparation 2, step 1, (1 g, 2.92 mmol, 1 eq)/ 10 ml THF at 0 °C under N₂ was added KHMDS (0.5 M in toluene, 7 ml, 1.2 eq) dropwise. 20 min later, CH₃I (0.36 ml, 2 eq) was added and the mixture was stirred overnight. After workup and flash chromatography (EtOAc:hexane, 1:10), 1 g of the

15

desired product was obtained. 2:1 rotamers were observed, the major one was reported as:

Example 1

Step 1:

- To (R)- α -ethylbenzylamine (19.8 g, 146.7 mmol, 1 eq) in EDC (30 ml) at 0 °C was added trifluoroacetic anhydride (25.3 ml, 1.22 eq) dropwise. The ice bath was removed and the mixture was stirred for 1.5 h. The crude was then cooled to 0 °C followed by the addition of I₂ (17.9 g, 0.48 eq) and bis(trifluoroacetoxy)iodobenzene (32.1 g, 0.51 eq). The dark purple mixture was stirred for 18 h until it became slightly yellow. 10 % Na₂S₂O₃ (330 ml) and CH₂Cl₂ (330 ml) were added and stirred at 0 °C for 0.5 h. After separation, the organic layer was washed with saturated NaHCO₃ until the pH of the aqueous layer was 9. After further extraction with CH₂Cl₂, the organic layers were combined and dried over Na₂CO₃. Removal of the solvent provided a white solid which was redissolved in CH₂Cl₂ (300 ml). The solution was treated with 1 liter of hexane and white solid precipitated. After filtration and washing with hexane and ether, 26.5 g of the desired product as white solid was obtained in 50 % yield.

15 Step 2:

- The product of Step 1 (25 g) was dissolved in CH₃OH (200 ml), treated with 3 N NaOH (100 ml) at 0 °C and gradually warmed up to rt overnight. The solvent was removed and the solution was extracted with CH₂Cl₂ followed by drying with Na₂CO₃. After removal of the solvent, 14 g of the desired product was obtained in 77 % yield.
- ¹HNMR (CDCl₃): δ 0.82 (d, 3 H, J = 7.3 Hz), 1.46 (s, 2 H), 1.60 (m, 2 H), 3.78 (t, 1 H, J = 6.7 Hz), 7.05 (d, 2 H, J = 8.3 Hz), 7.60 (d, 2 H, J = 8.3 Hz).
- ¹³CNMR (CDCl₃): δ 12.14, 33.60, 58.46, 93.10, 129.56, 138.35, 146.99.

The mixture was stirred under N₂ at rt for 20 h before being quenched with CH₃OH. The CH₃OH was removed and the crude was treated with 2N NH₃/CH₃OH for 0.5 h. The resin was further washed with CH₃OH, CH₂Cl₂ (3 times each) and dried under vacuum at 40 °C overnight.

Step 4:

The resin from Step 3 was treated with 10 eq of DIPEA and 2 eq of the product of Preparation 1 in CH_2Cl_2 at rt overnight. The resin was then washed with CH_2Cl_2 several times.

Step 5:

Example 3

Step 1:

- 5 To a stirring solution of 11 (4 gm) in THF (20 ml) at -78°C add CH_3MgBr (11 ml of a 3M solution in THF). After 30 min, warm to rt and then heat the reaction mixture at reflux temperature for 1 h and partition between saturated NH_4Cl and EtOAc. Wash the organic layers with 1N HCl and H_2O , dry over MgSO_4 and concentrate to dryness. Dissolve the residue (2.2 g) in CH_2Cl_2 (30 ml), add
- 10 triethylsilane (15 ml) and TFA (15 ml). After stirring overnight, concentrate the reaction mixture under reduced vacuum (135°C @ 2 mm Hg) to provide a yellow solid. Dissolve the solid (0.96 gm) in CH_2Cl_2 (30 ml), add $(\text{BOC})_2\text{O}$ (1.6 g) and 1 N NaOH (20 ml). After 2 h, separate the organic layer, wash with 1 N HCl, and dry over MgSO_4 . Concentrate the mixture under reduced pressure (1 mm Hg, 100°C) to
- 15 provide compound 11A as light yellow oil (1.14 g).

Step 2:

- To a solution of 11A (0.37 gm) in THF (10 ml) cooled to -78°C , add n-BuLi (0.6 ml of a 2.5 M solution in hexane) with stirring. After 30 min at -78°C , add a solution of 1-(4-iodophenyl)-propylisocyanate (prepare this from R- α -ethyl-4-iodo-
- 20 benzylamine from example 1, step 2, by reaction with triphosgene and proton sponge). After 15 min. add a solution of NH_4Cl and partition with CH_2Cl_2 . The CH_2Cl_2 layers are separated and concentrated and the residue purified by prep TLC using 1:3 EtOAc:Hex to yield a colorless oil (0.91 g). Treat this oil with 10 % TFA in CH_2Cl_2 (5 ml) for 2 h, then concentrate to dryness. Suspend a portion of this material (0.026 g)
- 25 in CH_2Cl_2 , add 6-quinoline-carboxaldehyde (0.016 g) and $\text{NaBH}(\text{OAc})_3$ (0.014 g). Stir the reaction overnight, then purify by prep TLC using EtOAc to give the title compound as a yellow oil. LCMS Rt 5.26min., observed mass 618.1 (M+H).
